

IBM InfoSphere Data Replication (Change Data Capture)

System environments are often heterogeneous. Data have to be exchanged between different sources and database management systems. Additionally database server resources are often exploited up to the breaking point while replicating a high volume of data. As a result you often suffer from database performance bottlenecks. In this scenario it is advisable to isolate the replication process from the database server. IBM InfoSphere Database Replication makes this possible and enables a reliable, fast and easy to handle data synchronization between (Informix) databases.

Audience: Developers, Database-/Systemadministrators, Group-/Project - Managers

Skills: Knowledge of relational databases & replication techniques

Methodology: Theoretical & practical exercises

Contents:

- **Introduction**
- **Comparison with HDR, CLR, CDR/ER**
- **Architecture**
- **Components & functions**
- **Overview replication scenarios (use cases)**
- **Replication (installation, configuration, handling)**
- **Monitoring**
- **Troubleshooting**
- **Best Practises**

Duration: 3 days

Price/Participant: 1.200,00 Euro + VAT

Training on site will be charged as follows: 992,00 EUR p. day + VAT independent from the number of participants.

Services:

- Small training groups
- Beverages & snacks
- Training material

Registration: o.hesse@hamburg-data.de oder Tel.: +49 40 875 00 589
